Introduction:

In a lot of cases, doctors are unable to diagnose the patient in time and that causes a lot of problems. This is why, we aim to design a diagnosis system, which will allow doctors to speed up the diagnosis process. In this way, doctors can rule out a lot of diseases and stick to the ones that are most likely to occur in the patient.

Problems and Solution:

In some cases, doctors need to work very quickly to find the disease that the patient is experiencing. However, they are not able to work fast enough, computers on the other hand are much faster. With this program, the doctor or user will only have to input the symptoms and the program will display all of the possible diseases. This will narrow down the search and make the doctor's job a bit easier.

Future Work:

This program has many uses in the future. It can help doctors from all over the world with their diagnosis and make their lives easier.
